## **DETAILED ACTION**

### ***Allowable Subject Matter***

1. Claim 33-50 are allowed.
2. The present invention is directed to a method for communication between the master device and the slave device. The prior arts in the record fail to teach or make obvious to a method comprising both channel level detector that read a level of a FIFO buffer of the slave device and aggregate level detector that determines storage level of a plurality of channels associated with the slave device where the master device control the transmission based on at least one of the event driven message and the periodic message within a structure of the claim. These features are claimed in the independent claims 33 and 41 and render them allowable.
